FORENSIC ANALYSIS REPORT

Acoustic Deepfake Detection · Powered by WavLM + Integrated Gradients + SHAP

VERDICT: DEEPFAKE / SYNTHETIC CONTENT DETECTED

WavLM neural network detected AI-generated content fingerprints with 80.2% confidence.

FAKE PROBABILITY	REAL PROBABILITY	VERDICT	CONFIDENCE
84.5%	15.6%	FAKE	80.2%

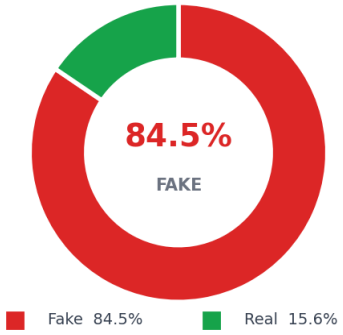
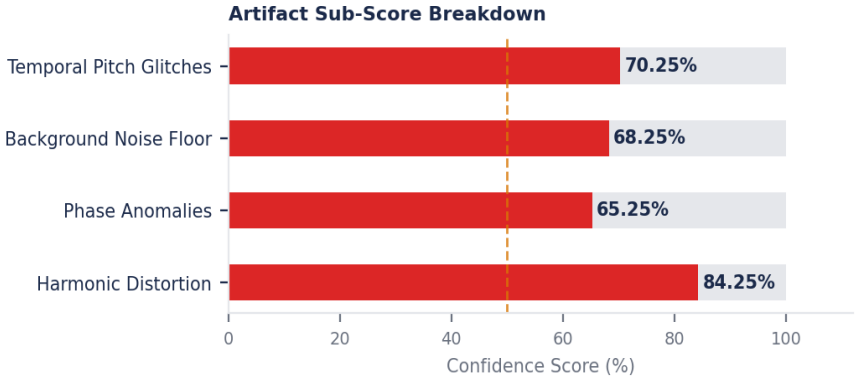
AUDIO ARTIFACT ANALYSIS



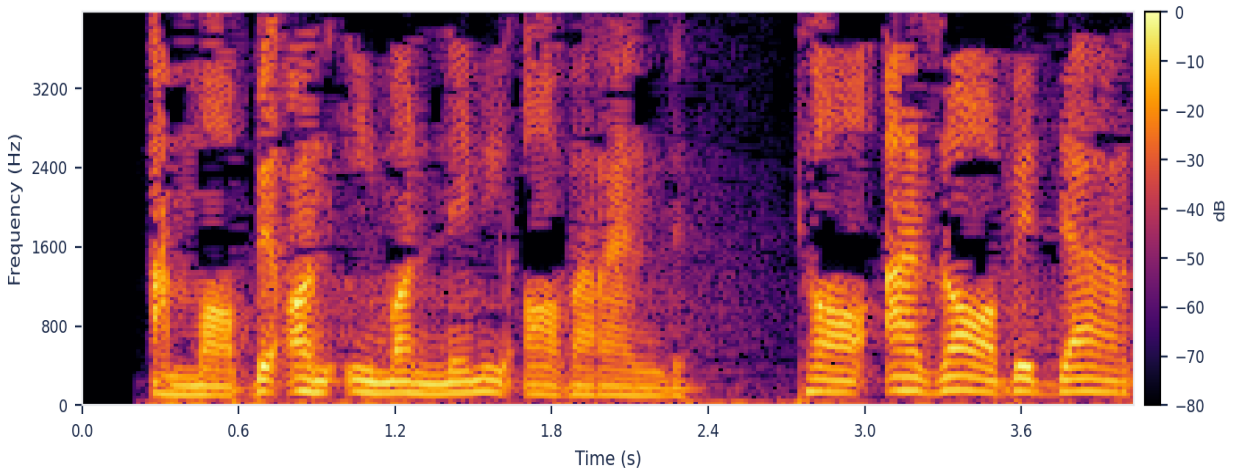


EXECUTIVE SUMMARY

WavLM feature extractor detected significant acoustic artifacts consistent with AI-generated audio or voice cloning. The classifier output indicates a 84.5% probability of synthetic generation.

ACOUSTIC FORENSICS MAP

The Short-Time Fourier Transform (STFT) spectrogram visualises the frequency content of the audio signal over time. Artificial speech synthesised by neural TTS models exhibits characteristic spectral anomalies such as unnatural harmonics.



DETECTED ACOUSTIC ANOMALIES

ANOMALY INDICATOR	VALUE	INTERPRETATION
Synthetic Speech Prob	84.45%	HIGH — exceeds EER threshold
Authenticity Prob	15.55%	Residual probability assigned to genuine class
Audio Duration	4.037s	Actual processed duration (padded to 4s)
